

Take advantage of subsoil moisture in 2012 with **LURE H₂O**

Good subsoil moisture presents an opportunity for growers this season. But one critical thing limiting this is the ability to get crops established early. LURE H₂O reduces this uncertainty by stopping runoff and capturing the early rains and banking the moisture.

By linking up the summer subsoil moisture with opening rains the LURE H₂O System* allows you to improve early crop and pasture establishment in hard to wet forest loams.

The graph below shows soil moisture levels at a 20cm depth. The LURE H₂O treated land captures the moisture as the rain falls, meaning more soil moisture available earlier in the season for better germination and growth.

Stop runoff and capture valuable early season rains

Don't miss the opportunity to link up subsoil moisture with opening rains

Find Out More at a Shed Talk Near You

SACOA are conducting a series of shed talks for growers. Contact your local reseller to attend one to ensure you get the best start to the season.

The LURE H₂O System* reduces the effects of water repellancy and locks the rain in the ground where it lands.
